A Treatise on the Theory of Functions

Including Diseases of Pregnancy, Labor, and the Puerperal State

Essays in Honor of Michael Henderson

This book is an elementary introduction to non-classical spectral theory. After the basic definitions and a reduction to the study of the functional model the discussion will be centered around the simplest variant of such a model which, formally speaking, comprises only the class of contraction operators with a one dimensional rank of non-unitarity ($\text{rank}(I - T^*T) = \text{rank}(I - TT^*) = 1$). The main emphasis is on the technical side of the subject, the book being mostly devoted to a development of the analytical machinery of spectral theory rather than to this discipline itself. The functional model of Sz. Nagy and Foiaş reduces the study of general operators to an investigation of the compression $T=PSIK$ of the shift operator S , $Sf = zf$, onto coinvariant subspaces (i. e. subspaces invariant with respect to the adjoint shift S^*). In the main body of the book (the "Lectures" in the proper meaning of the word) this operator acts on the Hardy space H^2 and is itself a part of the operator of multiplication by the independent variable in the space L^2 (in the case at hand L^2 means $L^2(\text{lf})$, lf being the unit circle), this operator again being fundamental for classical spectral theory.

A Complete Treatise on Electricity, in Theory and Practice

First published in 1966, here is presented a comprehensive overview of one of the most elusive scientific speculations by the pre-eminent genius of the 20th century. The theory is viewed by some scientists with deep suspicion, by others with optimism, but all agree that it represents an extreme challenge. As the author herself affirms, this work is not intended to be a complete treatise or 'didactic exposition' of the theory of unified fields, but rather a tool for further study, both by students and professional physicists. Dealing with all the major areas of research which together comprise the development of a working model, the author ranges over conservation equations, variational principles, solutions of spherical symmetry, and treats a wide selection of Einstein's own equations. The final chapter indicates problems associated with the unified field theory, in particular the energy-momentum tensor and geodesics.

This is a reproduction of a book published before 1923. This book may have occasional imperfections such as missing or blurred pages, poor pictures, errant marks, etc. that were either part of the original artifact, or were introduced by the scanning process. We believe this work is culturally important, and despite the imperfections, have elected to bring it back into print as part of our continuing commitment to the preservation of printed works worldwide. We appreciate your understanding of the imperfections in the preservation process, and hope you enjoy this valuable book.

Martinů's Mysterious Accident

With Graduated Sets of Exercises

Bohuslav Martinu (1890-1959) was one of the most prolific composers in the 20th century. Despite the fact that he lived for several years in the United States and had many of his works premiered in this country, he still stands as an enigma. This collection of essays by an international group of experts, is dedicated to the memory of Michael Henderson, who died in 1994 at the age of 47. Henderson was in the process of writing a biography of the composer. These essays include a range of new approaches to Martinu: Judy Mabary gives a concise history of Martinu's collaboration with choreographer Eric Hawkins, The Strangler; Ales Brezina looks penetratingly at the often tortured relationship between Martinu and the Czechoslovak government; and Michael Beckerman explores questions of construction in Martinu's Piano Concerto No. 2. Shorter pieces by Czech scholars Isa Popelka and Jaroslav Mihule are also included. In addition, there will be an essay by Michael Henderson on "Martinu's Mysterious Accident" which will shed light on one of the most harrowing events in the composer's life.

Spectral Function Theory

Jay L. Garfield defends two exegetical theses regarding Hume's Treatise on Human Nature. The first is that Book II is the theoretical foundation of the Treatise. Second, Garfield argues that we cannot understand Hume's project without an appreciation of his own understanding of custom, and in particular, without an appreciation of the grounding of his thought about custom in the legal theory and debates of his time. Custom is the source of Hume's thoughts about normativity, not only in ethics and in political theory, but also in epistemological, linguistics, and scientific practice- and is the source of his insight that our psychological and social natures are so inextricably linked. The centrality of custom and the link between the psychological and the social are closely connected, which is why Garfield begins with Book II. There are four interpretative perspectives at work in this volume: one is a naturalistic skeptical interpretation of Hume's Treatise; a second is the foregrounding of Book II of the Treatise as foundational for Books I and III. A third is the consideration of the Treatise in relation to Hume's philosophical antecedents (particularly Sextus, Bayle, Hutcheson, Shaftesbury, and Mandeville), as well as eighteenth century debates about the status of customary law, with one eye on its sequellae in the work of Kant, the later Wittgenstein, and in contemporary cognitive science. The fourth is the Buddhist tradition in which many of the ideas Hume develops are anticipated and articulated in somewhat different ways. Garfield presents Hume as a naturalist, a skeptic and as, above all, a communitarian. In offering this interpretation, he provides an understanding of the text as a whole in the context of the literature to which it responded, and in the context of the literature it inspired.
